## Product Selector Chart

The purpose of the Selector Chart is: provide at a "quick glance" information as to which product to select for the specific cleaning application. Angler Spray Cleaners will function in all types of Industrial Spray Washers that are currently being used in shops and plants. A number of the products were developed to operate in strip lines, where the spray contact times are often brief, less than 10 seconds.

For additional information on the selected cleaner always consult the Product Information Bulletin and the OSHA sheet, and the Angler Laboratory, if necessary.

As a rule Angler's Development Laboratory focus is to develop wherever possible products that are "green"-caustic, chelator, amine, and glycolether free.
